movistar

Home Station ADSL
Freedom in a box

User's guide

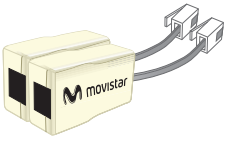
This guide details about the start up process for your Internet connection. You will be able to enjoy your connection in an easy, simple and quick way. Please follow the guide instructions step by step.

The advanced settings CD includes a video file (AyudaGrafica.exe) with a graphic help of the installation and configuration of your Internet connection.

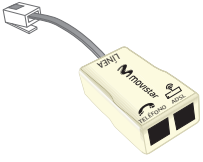
Package contents

(1) Home Station ADSL

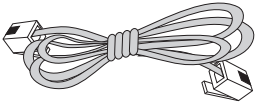
(2) Power adapter



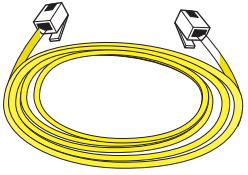
(3) Two ADSL microfilters



(4) Microfilter with double outlet ADSL and telephony line



(5) Telephone line cable



(6) Ethernet cable

(7) Advanced settings CD

movistar
CERTIFICADO DE
GARANTÍA
ESTA TARJETA NO DEBERA REMITIRSE A MOVISTAR
(Para ejercitar la garantía de este equipo, ver condiciones al dorso)

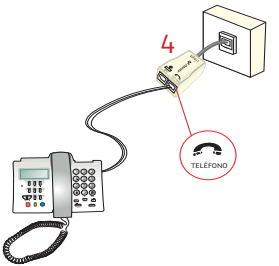
(8) Warranty card

For further information please refer to the user's manual on the advanced settings CD, section 2, or the glossary section in this guide.

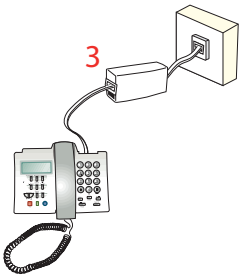
Start using your ADSL...

1. Microfilters installation

Connect a microfilter between each telephony device (telephones, faxes...) and the telephone socket.
Connect the microfilter with double outlet (4) to the selected telephone socket where the router will be connected and the telephone to the outlet labeled as (or TELÉFONO), as shown in the figure.

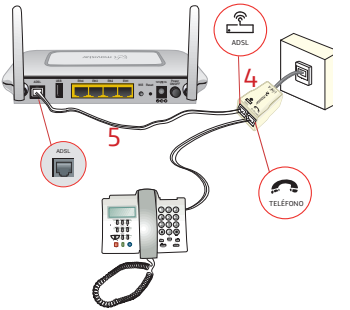


For the rest of the telephone sockets where there is connected a telephony terminal, you will just have to connect a microfilter (3).



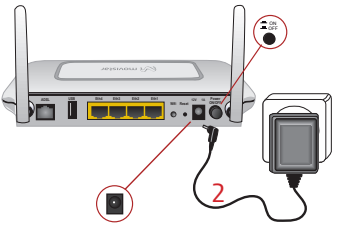
2. Telephone line connection

Connect the grey telephony line cable (5) to the free outlet of the microfilter with double outlet (4) labeled as (or ADSL) and to the connector of the Home Station ADSL labeled as **ADSL**.



3. Power adapter connection

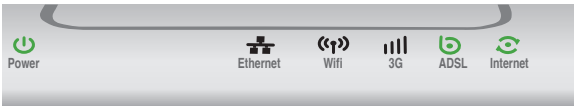
Plug the power adapter (2) into the mains supply and into the **12V 1A** connector of the Home Station ADSL.



For further information please refer to sections 3.2 and 3.3 of the user's manual on the advanced settings CD

4. Switching on the router

ON



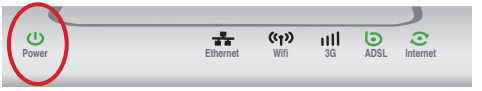
Turn the router on by putting the switch into the **ON** position. Wait for a few minutes until the LEDs shine as shown below.

Indicator	Current status	Description
Power	ON (green)	Status of the power supply.
Ethernet	OFF	Status of Ethernet connection.
Wifi	OFF	Status of wireless network.
3G	OFF	For future use.
ADSL	ON (green)	Connectivity established with the exchange.
Internet	ON (green)	Status of internet connection.

The routers provided by **Movistar** are optimised so that they can establish the connection with Internet without any need for installations or configurations.

Movistar can make a remote update of your equipment to offer you a better service, especially in the initial installation. During this update process the power indicator (the first one from the left) will flash in red.

After about 6-8 minutes the power indicator will light up in fixed green indicating the end of the process.



Warning: Don't turn off your Home Station ADSL while it is upgrading because it could damage your equipment.

For further information please refer to sections 3.4 of the user's manual on the advanced settings CD

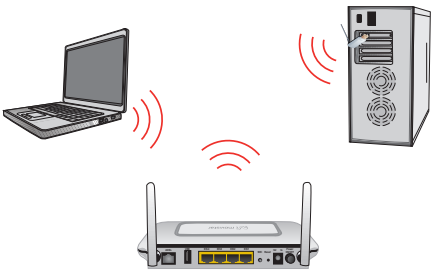
Start using your ADSL...

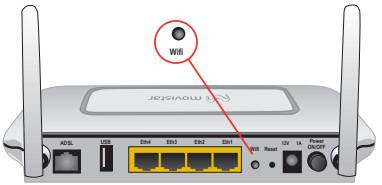
5. Connecting the computer to the router. Two options are available

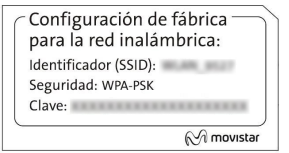
You may either connect your computer to the router using an Ethernet cable if they are sufficiently close to each other or by means of a wireless network. Furthermore, you can simultaneously have certain items of equipment connected to the router using the Ethernet cable and others as portable through the wireless network.

A. Connection using wireless network

You can use the wireless network as long as your computer is equipped with a wireless adapter installed or this is integrated into your equipment.
The first step will be to enable the wireless network for your router. This is done by pressing the button **Wifi** located at the back of the router within five seconds. The **Wifi** indicator will light up in green and will blink when navigating.







The next step is to configure the computers on your wireless network in accordance with your router's wireless parameters.

The configuration parameters by default for your wireless network are shown on the label at the bottom of your router.

For further information please refer to sections 3.5 of the User's manual on the advanced settings CD

If you are equipped with an external wireless device (PCM-CIA or USB adapter), install it with the aid of the CD that is provided with it. If you have a wireless device that is already integrated into your equipment, make sure that it is enabled with the aid of your operating system.

Connection using WPS

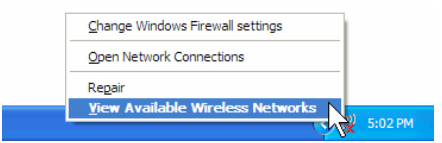
The router can use WPS for setting up a secure wireless network. Your wireless client device must support WPS for using it. Otherwise, use the method explained in "Connection using Windows wireless client".

Press the **Wifi** button located at the back of the router for more than five seconds and release it.

Press the **WPS** button on the wireless client device (check the device's documentation to see the details about this). You have two minutes for setting up the connection using WPS and, after this time, the router doesn't allow connection using WPS any more.

Connection using Windows wireless client

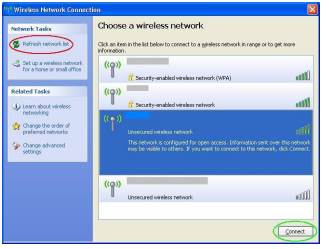
When configuring your wireless device in Windows XP SP2, Vista or Windows 7 **you can** use the wireless client management application. For Windows XP SP2 or Vista, press with the right mouse button on the wireless network connection icon on the system tray (next to the clock) and select "View available wireless networks". For Windows 7, press with the left mouse button on the same icon. For other operating systems refer to the wireless client assistance manual.



For further information please refer to sections 3.5 of the user's manual on the advanced settings CD.

Search the available wireless networks. You can update this list with the button "*Refresh network list*" or by clicking the button

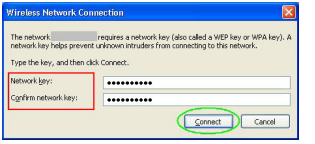
Select the network whose identifier (SSID) is the one that appears on the router label and press on **Connect**.



Wireless Network Connection
Network Tasks
Refresh network list
Set up a wireless network for a home or small office
Related Tasks
Learn about wireless networking
Change the order of preferred networks
Change advanced settings
Choose a wireless network
Click an item in the list below to connect to a wireless network in range or to get more information.
Security-enabled wireless network (WPA)
Security-enabled wireless network
Unsecured wireless network
The network is configured for open access. Information sent over this network may be visible to others. If you want to connect to this network, click Connect.
Unsecured wireless network
Connect

Enter the security key that appears on the router label.

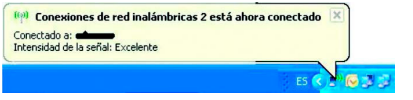
IMPORTANT. The wireless security key for the router is of the WPA/PSK type and its format is alphanumerical. Make sure you enter that security key exactly as it appears on the label.



Wireless Network Connection
The network requires a network key (also called a WEP key or WPA key). A network key helps prevent unknown intruders from connecting to this network.
Type the key, and then click Connect.
Network key:
Confirm network key:
Connect
Cancel

Connect to the wireless network (to do this, use the **Connect** or **OK** button).

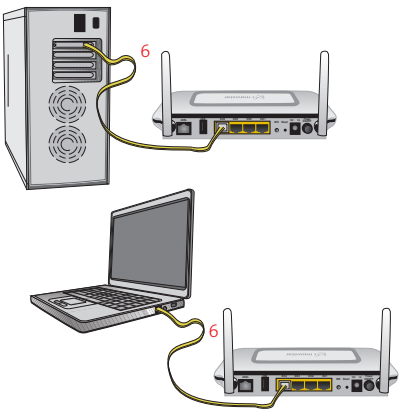
Check to make sure that the wireless network connection icon for the system tray indicates that the connection has been correctly established.



For further information please refer to sections 3.5 of the user's manual on the advanced settings CD.

B. Connection using Ethernet cable

Connect the yellow Ethernet cable (6) to the Ethernet card on the PC and to one of the router's connectors labelled as **Eth1 to Eth4**



Switch the PC on. The **ETHERNET** indicator will light up in green after a few seconds. This led will blink when transferring data.

For further information please refer to section 3.3 of the user's manual on the advanced settings CD.

Congratulations, now you can access Internet using your ADSL !

Open your browser, go to the web address www.movistar.es and start surfing the net.
Should you not be able to access, please see refer to the Solutions to frequent problems in this guide.

Activate your free e-mail accounts and your website with the Internet access service contracted.

Once you have accessed www.movistar.es, you can activate your mail account. After typing in the initial *identificador (user)* and *contraseña (password)* provided in the letter with the service data or the one obtained calling 900 50 20 10 from the telephone line where you have installed the ADSL service, you will access a website where you can publish your personal web pages.

Protect your PC

Once you are connected to the ADSL service we strongly recommend you to protect your PC against Internet viruses or attacks. If you wish to do so, you can contract these services (Antivirus PC, Anti-Intrusos PC, Pack Seguridad PC, etc.) at www.movistar.es, calling 1004 or through your usual channel.

Advanced settings CD

The CD is not required to set up your ADSL connection.

On the CD you will be able to find further help in response to any needs that might arise regarding your ADSL Internet connection.

Ayuda Conexión:
Graphic help which will guide you along the whole start up procedure to connect to the Internet and the advanced configuration of the ADSL Service. This help is in Spanish language.

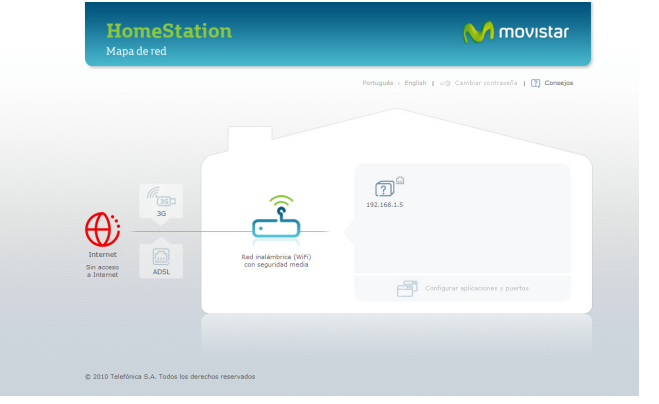
Agente ADSL:
An Advanced Configuration Tool which will allow you to carry out some advanced configuration tasks, such as opening ports, modifying the access password, etc.

Ver Documentación:
It includes more detailed information about the additional tools and certain aspects of your Internet connection. This documentation is in Spanish language.

Advanced options configuration

There are different ways to configure advanced options in your equipment:

- You can use the Advanced Configuration Tool included in Advanced options CD as we have said before.
- By using the web portal of the equipment accessing with your browser to the equipment URL that is by default http://192.168.1.1.



- You can use the Remote Configuration Portal(1) accesing to the URL www.movistar.es/configuramirouter

See the User's Guide included in the advanced options CD for further details about the web portal of the equipment and the Remote Configuration Portal.

(1) This feature is avalaible depending on your equipment model.

Solutions to frequent problems

Problem	Reason	Solution
The connection drops if I pick up the phone.	No microfilter has been installed between the phone device and the phone socket.	Verify that a microfilter has been installed between each telephony device (telephones, faxes...) and services which use the phone line (alarms, etc.) and the phone socket (see step 1 in the section "Start using your ADSL..." of this guide).
The Ethernet led does not light up.	The Ethernet cable is not correctly connected. (This is only a problem if you have decided to connect by cable and not by wireless network).	Verify that the Ethernet cable is correctly connected to the Ethernet connector and to the Ethernet card of your desktop PC or laptop computer (See Step 4 in the section "Start using your ADSL... " in this guide).
The ADSL led does not light up.	The phone line cable is not correctly connected.	Verify that the phone line cable is correctly connected to the ADSL connector and to the outlet labeled as "ADSL" of the microfilter with double outlet (See Step 1 in the section "Start using your ADSL... " in this guide).
Telephone calls are dropped or too much noise is heard.	There is no microfilter between the phone and the socket.	Verify that a microfilter has been installed between each telephony device (phones, faxes,...) and the socket (see step 1 in the section "Start using your ADSL..." of this guide).
	You have more than three microfilters simultaneously installed, which affects the quality of the phone service.	Verify that no firewall that may hinder the connection to the Internet is installed. See Appendix I of the User's guide contained in the advanced settings CD.
I cannot access Internet.	There is a firewall installed in your computer which prevents the connection to Internet.	Verify that no firewall that may hinder the connection to the Internet is installed. See appendix I of the user's guide contained in the advanced settings CD.
	You have hired a fixed IP addressing instead of a dynamic IP addressing, which is the default service.	In this case you must use the Setup Wizard included in the Advanced setting options CD to manually configure the router. See section 5 of the user's guide contained in the advanced settings CD.
	The TCP/IP protocol is not correctly installed for the network adapter used.	You must make sure that the TCP/IP protocol is correctly installed for the network adapter that the ADSL router is to be connected to. Refer to the Guide on the Ethernet card and TCP/IP protocol contained in the advanced settings CD.
	Sometimes the computer does not receive the IP address, the gateway or the DNS server data correctly through DHCP, owing to the fact the computer and the router are not simultaneously turned on.	We recommend that you reset both devices, first of all the router and then the computer.

Solutions to frequent problems

Problem	Reason	Solution
I do not have an icon for the wireless client.	Your wireless client is not correctly installed, set up or configured.	Make sure that your wireless client is correctly installed and enabled. More information is contained in the manual for the device itself.
The client management application does not show the network for my ADSL router (the one that appears on the label) as being one of the available networks.	The wireless network is disabled on the router.	Make sure that the wireless network for your ADSL router is enabled: the Wifi indicator is lit up in green.
I cannot connect to the ADSL router wireless network.	Your network identifier (SSID) is not being correctly indicated when you connect to it.	Check to make sure that you are using the same network identifier (SSID) throughout the network. Remember that it is case sensitive, i.e. a distinction is made between capital and small letters.
	You have not correctly configured the encryption used on your wireless network when connecting to it.	Check to make sure that you are using the same type of encryption and the same key for all the network elements. Remember that if you are using WEP encryption, you will have to select and configure the key number 1 in the configuration for wireless clients.
	The TCP/IP properties of your wireless client are not configured to receive IP via DHCP.	Make sure that the TCP/IP properties of the network adapter for your wireless client are configured to receive the IP dynamically (via DHCP). Refer to the assistance given in your operating system.
The connection with the wireless network is cut off frequently. The quality of the connection is not good.	Interference is being caused by other existing wireless networks.	If there is any interference affecting that channel, select a different one. If there are other wireless networks operating in the same zone, it is recommended that the networks be configured with a separation of 5 channels. For example, if there is a wireless network operating on channel 6 and we wish to install an additional wireless network, we must select channel 1, or 11. If this is not possible, select the one that causes the least impact (the least inundated channel, that is to say, the one with the lowest number of wireless networks.
	The wireless network signal is weak because the router is located in a place that is not very accessible or at a great distance.	Put the ADSL router in an unobstructed place. If there are network coverage problems, it is recommended that the antenna be moved to a different position. Remember that it is advisable to make sure that there are not many obstructions between the ADSL router and the wireless clients.

See the User's guide in the advanced settings CD for further details.
If you cannot solve the problem, please refer to the following section, which contains information about the customer care service.

Customer care

The customer care service is available via telephone as well as via Internet. For further information, please refer to chapter 6 in the user's manual.

All the information about ADSL can be found in the "Internet" section at movistar.es: www.movistar.es/adsl

Movistar technical customer care centres

Additional information

Telefónica de España, S.A.U. informs

We thank you the trust to have acquired a Movistar product and we inform you that for any clarification, query or complaint, you can call for free:

- **Personal care line (1004)**
- **Care center for professional and business (900 10 10 10)**
- **Business care center (900 12 09 00)**

Where you will be attended by our consultants or, if you prefere, visit Movistar web page:
www.movistar.es

For information about the after sales service, please see the equipment warranty card.

Finally, for written complaints regarding this sale, please contact with Telefónica de España S.A.U, Gran Vía 28, 28013 Madrid.

Environmental recycling

Do not dispose of this Home Station ADSL with your normal household waste. Ask your local authorities about the opportunities that are available for disposing of it correctly so that no damage is caused to the environment. Always comply with the applicable legal standards currently in force.

All offenders will be penalised or otherwise punished by Law.

Cardboard boxes, the plastic part of the packaging and the parts that constitute the device can be recycled in compliance with the standards currently in force in Spain where recycling is concerned.

The cross symbol on the container that is printed on the device, means that when the equipment has reached the end of its useful service life it must be taken to a special collection centre and that it must be processed separately from household waste.

DECLARATION OF CONFORMITY CE

Declarer:

Company Name	Amper Soluciones S. A.
Address	C/ Marconi, 3 (P.T.M.) 28760-Tres Cantos. Madrid.
Phone	91 724 3050
Fax	91 724 3010
CIF	A-28176949

Declare under its own responsability that the product

Product	Home Station ADSL
Brand name	Telefónica
Model	ASL-26555
Manufacturing country	China
Manufacturer	Alpha Networks Inc.

Is conformity with the technical specifications that are applicable on the day of the date by R & TTE Directive 1999/5/EC of the European Parliament and the Council of 9 March 1999, transposed into Spanish law by Royal Decree 1890/2000 Of 20 November 2000 and in particular with the harmonized standards:

Electromagnetic compatibility and Radio spectrum Matters (ERM); ElectroMagnetic Compatibility (EMC) standard for radio equipment and services; Part 1: Common technical requirements	EN 301 489-1 V1.8.1
Electromagnetic compatibility and Radio spectrum Matters (ERM); ElectroMagnetic Compatibility (EMC) standard for radio equipment; Part 17: Specific conditions for Broadband Data Transmission Systems	EN 301 489-17 V2.1.1
Electromagnetic compatibility and Radio spectrum Matters (ERM); Wideband transmission systems; Data transmission equipment operating in the 2,4 GHz ISM band and using wide band modulation techniques; Harmonized EN covering essential requirements under article 3.2 of the R&TTE Directive	EN 300 328 V1.7.1
Information technology equipment - Safety - Part 1: General requirements	EN 60950-1:2006 +A1:2010
Product standard to demonstrate the compliance of radio base stations and fixed terminal stations for wireless telecommunication systems with the basic restrictions or the reference levels related to human exposure to radio frequency electromagnetic fields (110 MHz - 40 GHz) - General public	EN 50385:2002
ADSL Access interface:	ANSI T1 413 i2, UNE-TBR 21, ETSI TS 102 913 V1.1.1
Wireless interface:	IEEE 802.11n

It is also conformity with the Energy Efficiency Directive 2009/125/EC and Regulation ErP 278/2009 on ecodesign requirements for energy-related products

It is also in accordance with Royal Decree RD-208/2005 (Directive 2002/95) on electrical and electronic equipment and residues management

Madrid, March 28, 2011

Fdo. Emilio Blanco Martín
Technical Director
Amper Soluciones

CE 0341 ⓘ Este equipo está preparado para su conexión a la red analógica de Telefónica de España, S.A.U., con acceso al servicio ADSL y su uso está autorizado exclusivamente en España.

Glossary

ADSL:
Asymmetric Digital Subscriber Line. It is a digital line for accessing Internet at high speed.

Antivirus:
An application that detects and removes any computer virus and other malicious programs.

DHCP (Dynamic Host Configuration Protocol):
A protocol that allows the hosts of a network to obtain the IP configuration settings automatically.

DNS (Domain Name System):
Domain Name Server. The server translates a domain name (the name of a machine) into its corresponding IP address.

Encryption or cryptography:
The science that enables one to encode and decipher information using techniques that make it possible to exchange messages in a safe and secure way, because they can only be read by the persons to whom they are addressed.

Ethernet cable:
A cable that is used to transmit data at high speed in Local Area Networks (LAN).

Firewall:
A hardware or software element that is used in a computer network to control and manage the network traffic, either allowing it or rejecting it, according to the network policies defined by the organisation that manages the network. It may block the establishment of the connection to the Internet.

Fixed / Dynamic IP addressing:
It indicates how Movistar assigns the IP address to your line. If every time that your router starts a session it can be assigned a different IP address, this indicates that your service includes dynamic addressing, which is the default type of addressing. However, if you are always assigned the same IP address, then your IP addressing service is fixed or static.

Microfilter:
It is an element which filters the ADSL signal and separate it from the phone signal, so that it is possible to make phone calls and surf at the same time without interruptions or drops.

PCMCIA:
It is a hardware element that is normally used in laptop computers to expand their capacities. The most common case is that of wireless network adapters, which are of this type.

Ports:
Physical or logical connections for sending or receiving data. It allows a program to communicate via the network.

Glossary

Socket:
A plug that is usually installed on the wall that enables the telephone cable to be connected.

SSID (Service Set Identifier):
A code included in all the packages of a wireless network so that they can be identified as being part of that network. An SSID thus enables one to make a distinction between the different wireless networks that exist.

TCP/IP (Transmission Control Protol/ Internet Protocol):
It is a set of network protocols upon which the Internet is based and which allow data to be transmitted between computer networks.

URL (Uniform Resource Locator):
It is a Uniform Resource Identifier (URI) that specifies where an identified resource is available and the mechanism for retrieving it. The best-known example of the use of URLs is for the addresses of web pages on Internet, such as:
http://www.movistar.es

Web browser or web explorer:
It is an application that enables the user to access and view hypertext document, commonly in HTML format, that is available on the Internet.

Web space:
It is a service that enables the user to offer his or her own web sites or documents so that they will be accessible on the Internet.

Web key:
A key that is used to authenticate a user who connects to a wireless network that uses this type of encryption (WEP). It permits encrypting of sent data.

Wireless client:
A hardware or software element that is used to connect to a network of computers without any kind of cable being used for the purpose.
